COMPOUNDS

The present invention relates to pyrrolobenzodiazepines (PBDs), and in particular pyrrolobenzodiazepines having a C2-C3 double bond, an aryl group at the C2 position, and particular substituents on that C2 aryl group.

Background to the invention

Some pyrrolobenzodiazepines (PBDs) have the ability to recognise and bond to specific sequences of DNA; the preferred sequence is PuGpu. The first PBD antitumour antibiotic, anthramycin, was discovered in 1965 (Leimgruber, et al., *J. Am. Chem. Soc.*, 87, 5793-5795 (1965); Leimgruber, et al., *J. Am. Chem. Soc.*, 87, 5791-5793 (1965)). Since then, a number of naturally occurring PBDs have been reported, and over 10 synthetic routes have been developed to a variety of analogues (Thurston, et al., *Chem. Rev.* 1994, 433-465 (1994)). Family members include abbeymycin (Hochlowski, et al., *J. Antibiotics*, 40, 145-148 (1987)), chicamycin (Konishi, et al., *J. Antibiotics*, 37, 200-206 (1984)), DC-81 (Japanese Patent 58-180 487; Thurston, et al., *Chem. Brit.*, 26, 767-772 (1990); Bose, et al., *Tetrahedron*, 48, 751-758 (1992)), mazethramycin (Kuminoto, et al., *J. Antibiotics*, 33, 665-667 (1980)), neothramycins A and B (Takeuchi, et al., *J. Antibiotics*, 29, 93-96 (1976)), porothramycin (Tsunakawa, et al., *J. Antibiotics*, 41, 1366-1373 (1988)), prothracarcin (Shimizu, et al., *J. Antibiotics*, 29, 2492-2503 (1982); Langley and Thurston, *J. Org. Chem.*, 52, 91-97 (1987)), sibanomicin (DC-102) (Hara, et al., *J. Antibiotics*, 41, 702-704 (1988); Itoh, et al., *J. Antibiotics*, 41, 1281-1284 (1988)), sibiromycin (Leber, et al., *J. Am. Chem. Soc.*, 110, 2992-2993 (1988)) and tomamycin (Arima, et al., *J. Antibiotics*, 25, 437-444 (1972)). PBDs are of the general structure:

They differ in the number, type and position of substituents, in both their aromatic A rings and pyrrolo C rings, and in the degree of saturation of the C ring. In the B-ring there is either an imine (N=C), a carbinolamine (NH-CH(OH)), or a carbinolamine methyl ether (NH-CH(OMe)) at the N10-C11 position which is the electrophilic centre responsible for alkylating DNA. All of the known natural products have an (S)-configuration at the chiral C11a position which provides them with a right-handed twist when viewed from the C ring towards the A ring. This gives them the appropriate three-dimensional shape for isohelicity with the minor groove of B-form DNA, leading to a snug fit at the binding site (Kohn, In *Antibiotics III*. Springer-Verlag, New York, pp. 3-11 (1975); Hurley and Needham-VanDevanter, *Acc. Chem. Res.*, **19**, 230-237 (1986)). Their ability to form an adduct in the minor groove, enables them to interfere with DNA processing, hence their use as antitumour agents.

The present inventors have previously disclosed, in WO 00/12508, that the following compounds, amongst many other, are cytotoxic:

More recently, in Cooper. N., et al., *Chem. Commun.*, **16**, 1764-1765 (2002), the following compound was also disclosed as being cytotoxic alongside the compounds shown above.

Disclosure of the invention

The present inventors have now discovered that a certain class of these compounds exhibit surprising activity against cancer cell lines, compared to the known compounds discussed above.

Therefore, a first aspect of the present invention is a compound of formula (I):

10

and salts, solvates, chemically protected forms, and prodrugs thereof, wherein:

R^6 , R^7 and R^9 are independently selected from H, R, OH, OR, SH, SR, NH_2 , NHR, NHRR', nitro, Me_3Sn and halo;

15 where R and R' are independently selected from optionally substituted C_{1-7} alkyl, C_{3-20} heterocyclyl and C_{5-20} aryl groups; R^8 is selected from H, R, OH, OR, SH, SR, NH_2 , NHR, NHRR', nitro, Me_3Sn and halo, or the compound is a dimer with each monomer being of formula (I), where the R^8 groups of each monomers form together

20 a dimer bridge having the formula $-X-R''-X-$ linking the monomers, where R'' is a C_{3-12} alkylene group, which chain may be interrupted by one or more heteroatoms, e.g. O, S, NH, and/or aromatic rings, e.g. benzene or pyridine, and each X is independently selected from O, S, or NH;

25 or any pair of adjacent groups from R^6 to R^9 together form a group $-O-(CH_2)_p-O-$, where p is 1 or 2; and R^2 is selected from:

- (i) an optionally substituted naphthyl group;
- (ii) an optionally substituted thiophenyl group; and

(iii) a phenyl group substituted by:

- (a) one or more chloro or fluoro groups;
- (b) an ethyl or propyl group;
- (c) a 4-t-butyl group; or
- (d) a 2-methyl group.

5

A second aspect of the present invention is the use of a compound of the first aspect of the invention in a method of therapy.

10 A third aspect of the present invention is a pharmaceutical composition containing a compound of the first aspect of the invention, and a pharmaceutically acceptable carrier or diluent.

15 A fourth aspect of the present invention provides the use of a compound of the first aspect of the invention in the manufacture of a medicament for treating a proliferative disease.

20 One of ordinary skill in the art is readily able to determine whether or not a candidate compound treats a proliferative condition for any particular cell type. For example, assays which may conveniently be used to assess the activity offered by a particular compound are described in the examples below.

25 The term "proliferative disease" pertains to an unwanted or uncontrolled cellular proliferation of excessive or abnormal cells which is undesired, such as, neoplastic or hyperplastic growth, whether *in vitro* or *in vivo*.

bone diseases, fibroproliferative disorders (e.g. of connective tissues), and atherosclerosis.

known ionic, salt, solvate, and protected forms of these

salt or solvate thereof, as well as conventional protected forms.
Similarly, a reference to an amino group includes the protonated
form (-N⁺HR¹R²), a salt or solvate of the amino group, for
example, a hydrochloride salt, as well as conventional protected
forms of an amino group. Similarly, a reference to a hydroxyl
group also includes the anionic form (-O⁻), a salt or solvate

Isomers, Salts, Solvates, Protected Forms, and Prodrugs

Certain compounds may exist in one or more particular geometric,
optical, enantiomeric, diastereomeric, epimeric, atropic,
stereoisomeric, tautomeric, conformational, or anomeric forms,
including but not limited to, cis- and trans-forms; E- and Z-
forms; c-, t-, and r- forms; endo- and exo-forms; R-, S-, and
meso-forms; D- and L-forms; d- and l-forms; (+) and (-) forms;
keto-, enol-, and enolate-forms; syn- and anti-forms; synclinal-
and anticlinal-forms; α- and β-forms; axial and equatorial forms;
boat-, chair-, twist-, envelope-, and halfchair-forms; and
combinations thereof, hereinafter collectively referred to as
"isomers" (or "isomeric forms").

35

Note that, except as discussed below for tautomeric forms,
specifically excluded from the term "isomers", as used herein,

are structural (or constitutional) isomers (i.e. isomers which differ in the connections between atoms rather than merely by the position of atoms in space). For example, a reference to a methoxy group, $-OCH_3$, is not to be construed as a reference to its structural isomer, a hydroxymethyl group, $-CH_2OH$. Similarly, a reference to ortho-chlorophenyl is not to be construed as a reference to its structural isomer, meta-chlorophenyl. However, a reference to a class of structures may well include structurally isomeric forms falling within that class (e.g. C_1 -alkyl includes n-propyl and iso-propyl; butyl includes n-, iso-, sec-, and tert-butyl; methoxyphenyl includes ortho-, meta-, and para-methoxyphenyl).

The above exclusion does not pertain to tautomeric forms, for example, keto-, enol-, and enolate-forms, as in, for example, the following tautomeric pairs: keto/enol (illustrated below), imine/enamine, amide/imino alcohol, amidine/amidine, nitroso/oxime, thioketone/enethiol, N-nitroso/hydroxyazo, and nitro/aci-nitro.

20

Note that specifically included in the term "isomer" are compounds with one or more isotopic substitutions. For example, H may be in any isotopic form, including ^1H , ^2H (D), and ^3H (T); C may be in any isotopic form, including ^{12}C , ^{13}C , and ^{14}C ; O may be in any isotopic form, including ^{16}O and ^{18}O ; and the like.

Unless otherwise specified, a reference to a particular compound includes all such isomeric forms, including (wholly or partially) racemic and other mixtures thereof. Methods for the preparation (e.g. asymmetric synthesis) and separation (e.g. fractional crystallisation and chromatographic means) of such isomeric forms are either known in the art or are readily obtained by adapting the methods taught herein, or known methods, in a known manner.

Unless otherwise specified, a reference to a particular compound also includes ionic, salt, solvate, and protected forms of thereof, for example, as discussed below.

- 5 It may be convenient or desirable to prepare, purify, and/or handle a corresponding salt of the active compound, for example, a pharmaceutically-acceptable salt. Examples of pharmaceutically acceptable salts are discussed in Berge, et al., *J. Pharm. Sci.*, 66, 1-19 (1977).

10

- For example, if the compound is anionic, or has a functional group which may be anionic (e.g. -COOH may be -COO^-), then a salt may be formed with a suitable cation. Examples of suitable inorganic cations include, but are not limited to, alkali metal ions such as Na^+ and K^+ , alkaline earth cations such as Ca^{2+} and Mg^{2+} , and other cations such as Al^{3+} . Examples of suitable organic cations include, but are not limited to, ammonium ion (i.e. NH_4^+) and substituted ammonium ions (e.g. NH_3R^+ , NH_2R_2^+ , NHR_3^+ , NR_4^+). Examples of some suitable substituted ammonium ions are those derived from: ethylamine, diethylamine, dicyclohexylamine, triethylamine, butylamine, ethylenediamine, ethanolamine, diethanolamine, piperazine, benzylamine, phenylbenzylamine, choline, meglumine, and tromethamine, as well as amino acids, such as lysine and arginine. An example of a common quaternary ammonium ion is $\text{N}(\text{CH}_3)_4^+$.

- If the compound is cationic, or has a functional group which may be cationic (e.g. -NH_2 may be -NH_3^+), then a salt may be formed with a suitable anion. Examples of suitable inorganic anions include, but are not limited to, those derived from the following inorganic acids: hydrochloric, hydrobromic, hydroiodic, sulfuric, sulfurous, nitric, nitrous, phosphoric, and phosphorous.
- 30

- Examples of suitable organic anions include, but are not limited to, those derived from the following organic acids:
- 35 2-acetyoxybenzoic, acetic, ascorbic, aspartic, benzoic, camphorsulfonic, cinnamic, citric, edetic, ethanedisulfonic,

ethanesulfonic, fumaric, glucheptonic, gluconic, glutamic, glycolic, hydroxymaleic, hydroxynaphthalene carboxylic, isethionic, lactic, lactobionic, lauric, maleic, malic, methanesulfonic, mucic, oleic, oxalic, palmitic, pamoic, 5 pantothenic, phenylacetic, phenylsulfonic, propionic, pyruvic, salicylic, stearic, succinic, sulfanilic, tartaric, toluenesulfonic, and valeric. Examples of suitable polymeric organic anions include, but are not limited to, those derived from the following polymeric acids: tannic acid, carboxymethyl 10 cellulose.

It may be convenient or desirable to prepare, purify, and/or handle a corresponding solvate of the active compound. The term "solvate" is used herein in the conventional sense to refer to a 15 complex of solute (e.g. active compound, salt of active compound) and solvent. If the solvent is water, the solvate may be conveniently referred to as a hydrate, for example, a mono-hydrate, a di-hydrate, a tri-hydrate, etc.

20 It may be convenient or desirable to prepare, purify, and/or handle the active compound in a chemically protected form. The term "chemically protected form" is used herein in the conventional chemical sense and pertains to a compound in which one or more reactive functional groups are protected from 25 undesirable chemical reactions under specified conditions (e.g. pH, temperature, radiation, solvent, and the like). In practice, well known chemical methods are employed to reversibly render unreactive a functional group, which otherwise would be reactive, under specified conditions. In a chemically protected form, one 30 or more reactive functional groups are in the form of a protected or protecting group (also known as a masked or masking group or a blocked or blocking group). By protecting a reactive functional group, reactions involving other unprotected reactive functional groups can be performed, without affecting the protected group; 35 the protecting group may be removed, usually in a subsequent step, without substantially affecting the remainder of the molecule. See, for example, "Protective Groups in Organic

Synthesis" (Green, T. and Wuts, P.; 3rd Edition; John Wiley and Sons, 1999).

A wide variety of such "protecting", "blocking", or "masking" methods are widely used and well known in organic synthesis. For example, a compound which has two nonequivalent reactive functional groups, both of which would be reactive under specified conditions, may be derivatized to render one of the functional groups "protected", and therefore unreactive, under the specified conditions; so protected, the compound may be used as a reactant which has effectively only one reactive functional group. After the desired reaction (involving the other functional group) is complete, the protected group may be "deprotected" to return it to its original functionality.

For example, a hydroxy group may be protected as an ether (-OR) or an ester (-OC(=O)R), for example, as: a t-butyl ether; a benzyl, benzhydryl (diphenylmethyl), or trityl (triphenylmethyl) ether; a trimethylsilyl or t-butyldimethylsilyl ether; or an acetyl ester (-OC(=O)CH₃, -OAc).

For example, an aldehyde or ketone group may be protected as an acetal (R-CH(OR)₂) or ketal (R₂C(OR)₂), respectively, in which the carbonyl group (>C=O) is converted to a diether (>C(OR)₂), by reaction with, for example, a primary alcohol. The aldehyde or ketone group is readily regenerated by hydrolysis using a large excess of water in the presence of acid.

For example, an amine group may be protected, for example, as an amide (-NRCO-R) or a urethane (-NRCO-OR), for example, as: a methyl amide (-NHCO-CH₃); a benzyloxy amide (-NHCO-OCH₂C₆H₅, -NH-Cbz); as a t-butoxy amide (-NHCO-OC(CH₃)₃, -NH-Boc); a 2-biphenyl-2-propoxy amide (-NHCO-OC(CH₃)₂C₆H₄C₆H₅, -NH-Bpoc), as a 9-fluorenylmethoxy amide (-NH-Fmoc), as a 6-nitroveratryloxy amide (-NH-Nvoc), as a 2-trimethylsilylethyloxy amide (-NH-Teoc), as a 2,2,2-trichloroethyloxy amide (-NH-Troc), as an allyloxy amide (-NH-Alloc), as a 2(-phenylsulphonyl)ethyloxy amide (-NH-Psec);

or, in suitable cases (e.g., cyclic amines), as a nitroxide radical ($>\text{N}-\text{O}^\bullet$).

For example, a carboxylic acid group may be protected as an ester
 5 for example, as: an C_{1-7} alkyl ester (e.g. a methyl ester; a t-butyl ester); a C_{1-7} haloalkyl ester (e.g. a C_{1-7} trihaloalkyl ester); a tri C_{1-7} alkylsilyl- C_{1-7} alkyl ester; or a C_{5-20} aryl- C_{1-7} alkyl ester (e.g. a benzyl ester; a nitrobenzyl ester); or as an amide, for example, as a methyl amide.

10 For example, a thiol group may be protected as a thioether ($-\text{SR}$), for example, as: a benzyl thioether; an acetamidomethyl ether ($-\text{S}-\text{CH}_2\text{NHC}(=\text{O})\text{CH}_3$).

15 It may be convenient or desirable to prepare, purify, and/or handle the active compound in the form of a prodrug. The term "prodrug", as used herein, pertains to a compound which, when metabolised (e.g. *in vivo*), yields the desired active compound. Typically, the prodrug is inactive, or less active than the
 20 active compound, but may provide advantageous handling, administration, or metabolic properties.

For example, some prodrugs are esters of the active compound (e.g. a physiologically acceptable metabolically labile ester).
 25 During metabolism, the ester group ($-\text{C}(=\text{O})\text{OR}$) is cleaved to yield the active drug. Such esters may be formed by esterification, for example, of any of the carboxylic acid groups ($-\text{C}(=\text{O})\text{OH}$) in the parent compound, with, where appropriate, prior protection of any other reactive groups present in the parent compound,
 30 followed by deprotection if required.

Also, some prodrugs are activated enzymatically to yield the active compound, or a compound which, upon further chemical reaction, yields the active compound (for example, as in ADEPT,
 35 GDEPT, LIDEPT, etc.). For example, the prodrug may be a sugar derivative or other glycoside conjugate, or may be an amino acid ester derivative.

In particular, prodrugs of pyrrolobenzodiazepines are described in WO 00/12507, which is incorporated herein by reference. In these prodrugs a nitrogen protecting group which can be removed *in vivo* (e.g. enzymatically, using light) is bound to the nitrogen of the imine group, with the carbon of the imine group bearing a hydroxy, ester or thioester group. Examples of this form of protection include:

10 , which is nitroreductase labile (e.g. using ADEPT/GDEPT);

and , which are photolabile;

and

15 which is glutathione labile (e.g. using NPEPT).

General synthetic routes

A key intermediate in the synthesis of the compounds of the present invention is the following compound, an enol triflate, of formula (A):

- 5 wherein the groups R^6 to R^9 are as for the final product, SEM represents a trimethyl silyl ethoxy methyl group, and OTf represents the group OSO_2CF_3 . The synthesis of this compound is described in detail in WO 00/12508, which is incorporated herein
- 10 by reference. In particular, reference is made to scheme 7 on page 24, where the above compound is designated as intermediate P. The SEM protecting group can be replaced by other suitable nitrogen protecting groups.
- 15 The route from this compound to the desired final product is illustrated in scheme 1.

Scheme 1

- 20 The key enol triflate intermediate (A) can be converted to the appropriate SEM protected dilactam (B) by use of a Suzuki coupling reaction, i.e. palladium catalysed cross coupling of the enol triflate (A) with the appropriate arylboron derivative.

The SEM protected dilactam (B) can then be converted to the desired final compound of formula (I) by reduction, which leads to a protected carbinolamine intermediate, which can then be
5 treated to remove the SEM protecting group. The reduction of the dilactam (B) can be accomplished by, for example, sodium tetraborohydride, whilst a suitable means for removing the SEM protecting group is treatment with silica gel.

10 This synthesis route is equally applicable to the synthesis of dimers.

Further Uses

The present invention also provides compounds as described in the
15 first aspect of the invention which regulate (e.g. inhibit) cell proliferation. Thus, the present invention also provides methods of regulating (e.g. inhibiting) cell proliferation, *in vitro* or *in vivo*, comprising contacting a cell with an effective amount of a compound of the first aspect of the invention.

20 In particular, this inhibition may be of certain cell lines as disclosed in the examples.

One of ordinary skill in the art is readily able to determine
25 whether or not a candidate compound regulate (e.g. inhibit) cell proliferation. For example, assays which may conveniently be used to assess the activity offered by a particular compound are described in the examples below.

30 For example, a sample of cells (e.g. from a tumour) may be grown *in vitro* and a test compound brought into contact with said cells, and the effect of the compound on those cells observed. As an example of "effect" the morphological status of the cells (e.g. alive or dead, etc.) may be determined. Where the test
35 compound is found to exert an influence on the cells, this may be used as a prognostic or diagnostic marker of the efficacy of the

compound in methods of treating a patient carrying cells of the same cellular type.

Methods of Treatment

- 5 As described above, the second aspect of the invention provide the use of a compound of the first aspect of the invention in a method of therapy. Also provided is a method of treatment, comprising administering to a subject in need of treatment a therapeutically-effective amount of a compound of the first
- 10 aspect of the invention, preferably in the form of a pharmaceutical composition, which is the third aspect of the present invention. The term "therapeutically effective amount" is an amount sufficient to show benefit to a patient. Such benefit may be at least amelioration of at least one symptom.
- 15 The actual amount administered, and rate and time-course of administration, will depend on the nature and severity of what is being treated. Prescription of treatment, e.g. decisions on dosage, is within the responsibility of general practitioners and other medical doctors.
- 20 A compound may be administered alone or in combination with other treatments, either simultaneously or sequentially dependent upon the condition to be treated. Examples of treatments and therapies include, but are not limited to, chemotherapy (the
- 25 administration of active agents, including, e.g. drugs; surgery; and radiation therapy.

Pharmaceutical compositions according to the present invention, and for use in accordance with the present invention, may

30 comprise, in addition to the active ingredient, i.e. a compound of formula I, a pharmaceutically acceptable excipient, carrier, buffer, stabiliser or other materials well known to those skilled in the art. Such materials should be non-toxic and should not interfere with the efficacy of the active ingredient. The

35 precise nature of the carrier or other material will depend on the route of administration, which may be oral, or by injection, e.g. cutaneous, subcutaneous, or intravenous.

Pharmaceutical compositions for oral administration may be in tablet, capsule, powder or liquid form. A tablet may comprise a solid carrier or an adjuvant. Liquid pharmaceutical compositions
5 generally comprise a liquid carrier such as water, petroleum, animal or vegetable oils, mineral oil or synthetic oil. Physiological saline solution, dextrose or other saccharide solution or glycols such as ethylene glycol, propylene glycol or polyethylene glycol may be included. A capsule may comprise a
10 solid carrier such as gelatin.

For intravenous, cutaneous or subcutaneous injection, or injection at the site of affliction, the active ingredient will be in the form of a parenterally acceptable aqueous solution
15 which is pyrogen-free and has suitable pH, isotonicity and stability. Those of relevant skill in the art are well able to prepare suitable solutions using, for example, isotonic vehicles such as Sodium Chloride Injection, Ringer's Injection, Lactated Ringer's Injection. Preservatives, stabilisers, buffers,
20 antioxidants and/or other additives may be included, as required.

The following preferences may apply to all aspects of the invention as described above, or may relate to a single aspect.
25 The preferences may be combined together in any combination.

R^6 is preferably selected from H, OH, OR, SH, NH_2 , nitro and halo,
35 and is more preferably H or halo, and most preferably is H.

R^7 and R^8 (when the compound is not a dimer) are preferably independently selected from H, OH, OR, SH, SR, NH_2 , NHR, $NHRR'$, and halo, and more preferably independently selected from H, OH and OR, where R is preferably selected from optionally substituted C_{1-7} alkyl, C_{3-10} heterocyclyl and C_{5-10} aryl groups. Particularly preferred substituents at the 7- and 8- positions are OMe and OCH_2Ph .

R^2

10 In one set of embodiments R^2 is an optionally substituted naphthyl group. Preferred substituents include: halo, more particularly chloro and fluoro; C_{1-7} alkyl groups, more particularly C_{1-4} alkyl groups, e.g. methyl and t-butyl; ether groups, more particularly C_{1-4} alkoxy groups, e.g. methoxy and benzyloxy; C_{5-20} aryl groups, particularly phenyl.

The naphthyl group may be linked to the main PBD moiety at any position on its ring system. For example, if the naphthyl is unsubstituted, then the group may either be naphth-1-yl or naphth-2-yl, with naphth-2-yl being preferred.

Especially preferred naphthyl groups include: naphth-2-yl, 6-methoxy-naphth-2-yl, 6-ethoxy-naphth-2-yl and fluoro and/or chloro substituted naphthyl groups, with single substituted fluoro or chloro naphth-2-yls being most preferred.

Biological assay

In order to determine the activity of the compounds synthesised, solid human tumour xenografts growing subcutaneously in serial passages in thymus aplastic nude mice (Naval Medical Research Institute, USA nu/nu strain) were removed under sterile condition, mechanically disaggregated and subsequently incubated with an enzyme cocktail consisting of collagenase (41U/ml, Sigma), DNase I (125 U/ml, Roche), hyaluronidase (1000 U/ml, Sigma) and dispase II(1.0 U/ml) in RPMI 1640-Medium (Life Technologies) at 37°C for 30 minutes. Cells were passed through sieves of 200 µm and 50 µm mesh size and washed twice with sterile PBS-buffer. The percentage of viable cells was determined in a Neubauer-hemocytometer using trypan blue exclusion. The cells generated were as follows:

The clonogenic assay was performed in a 24-well format according to a modified two-layer agar assay introduced by Hamburger, A.W. and Salmon, S.E., *Science*, 197, 461-643 (1977). The bottom layer consisted of 0.2 ml/well of Iscove's Modified Dulbecco's Medium (supplemented with 20% fetal calf serum and 1% gentamicin) and 0.75% agar. 4×10^4 to 8×10^4 cells were added to 0.2 ml of the same culture medium supplemented with 0.4 % agar and plated in 24-multiwell dishes onto the bottom layer. The test compounds were applied by continuous exposure (drug overlay) in 0.2 ml culture medium. Each dish included six control wells containing the vehicle and drug treated groups in triplicate at 6 concentrations. Cultures were incubated at 37°C and 7.5% CO₂ in a humidified atmosphere for 8-20 days and monitored closely for colony growth using an inverted microscope. Within this period, *in vitro* tumour growth led to the formation of colonies with a diameter of >50 µm. At the time of maximum colony formation, counts were performed with an automatic image analysis system (OMNICOM FAS IV, Biosys GmbH). 24 hours prior to evaluation, vital colonies were stained with a sterile aqueous solution of 2-(4-iodophenyl)-3-(4-nitrophenyl)-5-phenyltetrazolium chloride (1 mg/ml, 100 µl/well).

The IC₅₀ values of the test compounds were determined by plotting compound concentration versus cell viability.
